

FileWhich

Luca Santarella - Prof. Kirtman

Files Included

- `filewhich.sh`
- `filewhich2.sh`

`filewhich.sh`

This program uses glob expansion to check if a supplied file exists in the set of directories supplied by a colon separated list in either the argument `-p` or the bash variable `$FILEPATH`.

Usage

```
Usage: filewhich [-a] [-p /path/to/files:/path/to/more/files] file_name
```

Arguments

Arg	Description	Required	Parameters
<code>-a</code>	Show all - Shows all files that match the supplied file name.	NO	NONE
<code>-p</code>	File Paths - Search this colon separated list of paths for the supplied filename. Alternatively, the shell variable <code>\$FILEPATH</code> will be referenced. If neither are available, the program will exit with an error.	NO	A colon separated list of paths. Ex. <code>/path/to/files:/path/to/more/files</code>

`filewhich2.sh`

This program uses `test`'s (`[`) `-e` option to check if a supplied file exists in the set of directories

supplied by a colon separated list in either the arugment `-p` or the bash variable `$FILEPATH` .

Usage

Usage: `filewhich [-a] [-p /path/to/files:/path/to/more/files] file_name`

Arguments

Arg	Description	Required	Parameters
<code>-a</code>	Show all - Shows all files that match the supplied file name.	NO	NONE
<code>-p</code>	File Paths - Search this colon separated list of paths for the supplied filename. Alternatively, the shell vairable <code>\$FILEPATH</code> will be referenced. If neither are available, the program will exit with an error.	NO	A colon separated list of paths. Ex. <code>/path/to/files:/path/to/more/files</code>
